Skill Builder Pack 4C - AVERAGE / AVERAGEIF / AVERAGEIFS

We are now working with spreadsheet **SKILL 4C AVERAGES**

	A	B	C	D	E	F	G
1	student_name	Attendance Status	Delivery Mode	Engagement Score Weekly	Engagement Risk Band		
2	Ali Khan	Present	Remote	53	High		
3	Ali Khan	Present	Remote	53	High		
4	David Wilson	Present	On Campus	68	Medium		
5	Sarah Smith	Present	On Campus	82	Low		
6	James Taylor	Authorised Absence	On Campus	83	Low		
7	Lily Brown	Present	Remote	84	Low		
8	Emily Clark	Absent	On Campus	91	Low		
9	Daniel Green	Present	Hybrid	92	Low		
10	Sophia White	Present	Hybrid	65	Medium		
11	Lucas Hall	Present	Remote	76	Low		
12	Olivia King	Late	Remote	82	Low		
13	Henry Scott	Present	On Campus	83	Low		
14	Ava Turner	Present	On Campus	66	Medium		
15	Jack Hill	Present	Remote	63	Medium		
16	Mia Adams	Present	On Campus	86	Low		
17	Noah Baker	Present	Remote	82	Low		
18	Grace Nelson	Present	On Campus	93	Low		
19	Leo Carter	Present	On Campus	76	Low		
20	Ella Mitchell	Present	Remote	77	Low		
21	Oscar Perez	Present	Remote	56	High		
22	Isla Roberts	Present	Hybrid	84	Low		
23	Amelia Walker	Authorised Absence	On Campus	85	Low		
24	Ethan Phillips	Present	Hybrid	76	Low		
25	Freya Campbell	Present	Remote	69	Medium		
26	Benjamin Parker	Present	Remote	88	Low		
27	Chloe Evans	Present	On Campus	94	Low		
28	Arthur Edwards	Present	Hybrid	77	Low		
29	Sienna Collins	Present	Remote	78	Low		
30	Thomas Stewart	Present	Remote	79	Low		
31	Evie Morris	Absent	Hybrid	70	Medium		
32							
33							
34							
35							

Key Idea

We are now answering:

> “What is typical?”

Instead of counting or adding, Excel will:

- add all the numbers
- then divide by how many there are

SECTION 1 — AVERAGE (no conditions)

Question 1

What is the average engagement score?

What you do:

Use AVERAGE on the Engagement Score column

What Excel is doing:

1. Excel looks down the Engagement Score column.
2. It adds all the numbers together.
3. Then it divides by how many values there are.

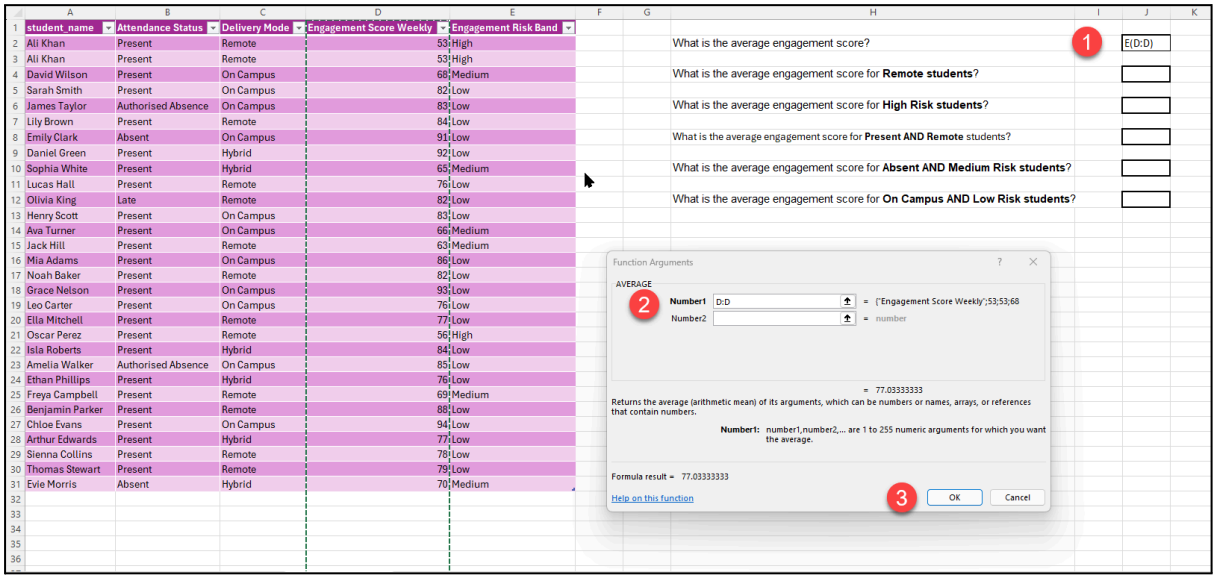
So:

- Total = 2311
- Number of rows = 30

Average = 200 ÷ 3 = 77.03

Using Excel functions

1. Select cell J2, fo to fx, search for AVERAGE and click on **OK**
2. For **Number1**, select the *Engagement Score Weekly column (column D)*
3. Click **OK**
4. The average score will be calculated and returned (77.03)



SECTION 2 — AVERAGEIF (one condition)

Key Idea

AVERAGEIF = average where ONE rule is true

Question 2

What is the average engagement score for **Online students**?

What Excel is doing:

1. Excel looks at each row.
2. It checks: “Is Delivery Mode = Online?”

If YES → include the score
If NO → ignore it

Important:

Excel only averages the values that match

Example:

Delivery	Score	Used?
Online	85	✅ Yes
Remote	45	❌ No
Online	70	✅ Yes

1. Click on cell J4, click fx and search for AVERAGEIF then click on **OK** to open the Wizard
2. For **Range**, select the column you want to filter, in this case *Delivery Mode* which is *column C* and type *Remote* as the **Criteria**
3. Next select the column which contains the numbers you want to average in the **Average_range** box, in this case *Engagement Score Weekly, column D*
4. This will now calculate the average engagement score JUST of learners who are Remote - in this case 75.3077

student_name	Attendance Status	Delivery Mode	Engagement Score Weekly	Engagement Risk Band
Ali Khan	Present	Remote	53	High
Ali Khan	Present	Remote	53	High
David Wilson	Present	On Campus	68	Medium
Sarah Smith	Present	On Campus	82	Low
James Taylor	Authorised Absence	On Campus	83	Low
Lily Brown	Present	Remote	84	Low
Emily Clark	Absent	On Campus	91	Low
Daniel Green	Present	Hybrid	92	Low
Sophia White	Present	Hybrid	65	Medium
Lucas Hall	Present	Remote	76	Low
Olivia King	Late	Remote	82	Low
Henry Scott	Present	On Campus	83	Low
Ava Turner	Present	On Campus	66	Medium
Jack Hill	Present	Remote	63	Medium
Mia Adams	Present	On Campus	86	Low
Noah Baker	Present	Remote	82	Low
Grace Nelson	Present	On Campus	93	Low
Leo Carter	Present	On Campus	76	Low
Ella Mitchell	Present	Remote	77	Low
Oscar Perez	Present	Remote	56	High
Isla Roberts	Present	Hybrid	84	Low
Amelia Walker	Authorised Absence	On Campus	85	Low
Ethan Phillips	Present	Hybrid	76	Low
Freya Campbell	Present	Remote	69	Medium
Benjamin Parker	Present	Remote	88	Low
Chloe Evans	Present	On Campus	94	Low
Arthur Edwards	Present	Hybrid	77	Low
Sienna Collins	Present	Remote	78	Low
Thomas Stewart	Present	Remote	79	Low
Evie Morris	Absent	Hybrid	70	Medium

What is the average engagement score? 77.03333

What is the average engagement score for **Remote students**? 1 D)

What is the average engagement score for **High Risk students**?

What is the average engagement score for **Present AND Remote** students?

What is the average engagement score for **Absent AND Medium Risk students**?

What is the average engagement score for **On Campus AND Low Risk students**?

Function Arguments

AVERAGEIF

2 Range C:C = {"Delivery Mode";"Remote";"Remote";"

Criteria "Remote" = "Remote"

3 Average_range D:D = {"Engagement Score Weekly";53;53;68

= 72.30769231

Finds average(arithmetic mean) for the cells specified by a given condition or criteria.

Average_range are the actual cells to be used to find the average. If omitted, the cells in range are used.

Formula result = 72.30769231

Help on this function

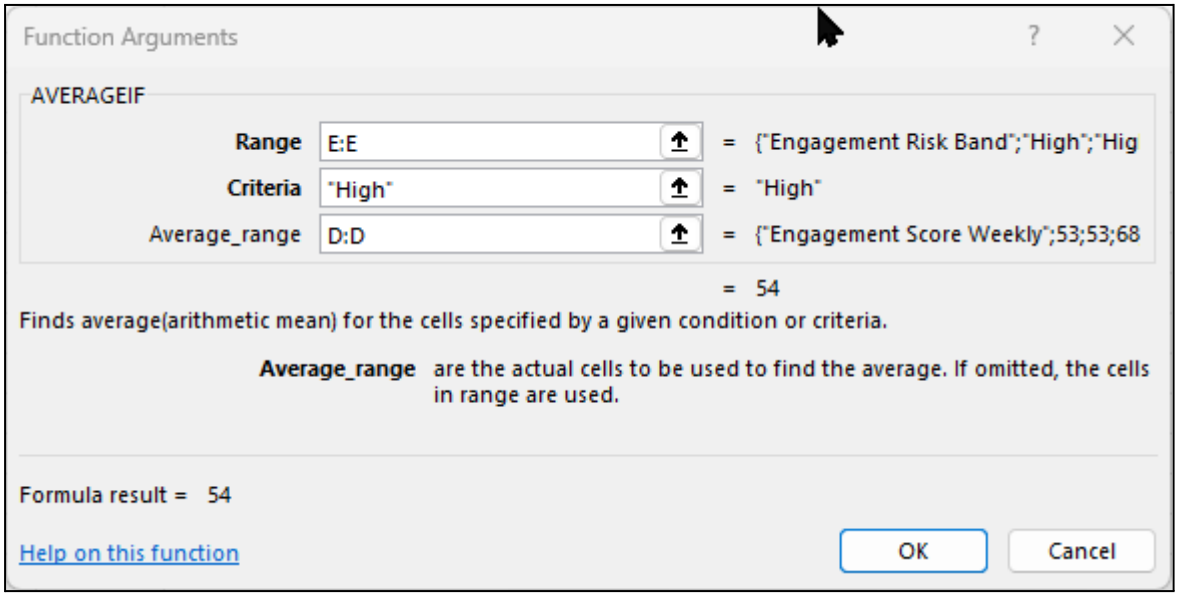
4 OK Cancel

Question 3

What is the average engagement score for **High Risk students**?

What Excel is doing:

1. Excel checks the Risk column
2. If it sees “High” → include the score
3. Otherwise → ignore



Your result should be 54

SECTION 3 — AVERAGEIFS (multiple conditions)

Key Idea

AVERAGEIFS = average where MULTIPLE rules are true

> "this AND this"

Question 4

What is the average engagement score for **Present AND Remote students**?

What Excel is doing:

For each row:

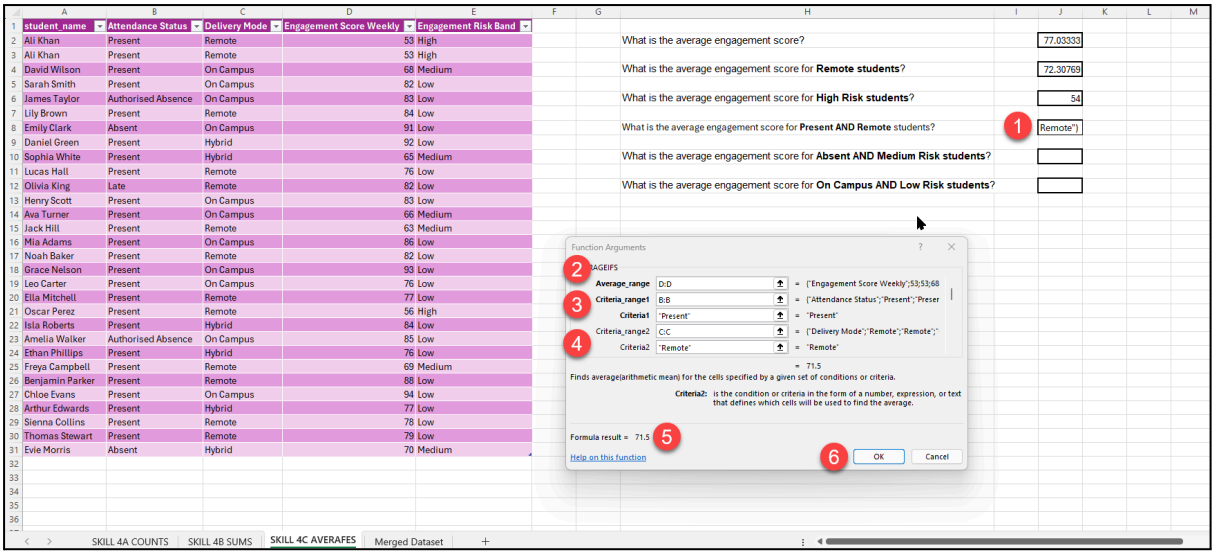
1. Is Attendance Status = Present?
2. Is Delivery Mode = Remote?

Only if BOTH are true → include the score

Example:

Attendance	Delivery	**Score**	**Used?**
Present	Remote	85	✅ Yes
Online	Absent	45	❌ No
In Person	Present	70	❌ No

1. Click on cell J8, go to fx and search for AVERAGESIFS then click on OK
2. **Average_range** contains the numbers you want to average, so select *column D, Engagement Score Weekly*
3. For the first criteria option group, set **Criteria_range1** to *Attendance Status (column B)* and the **Criteria** to *Present*
4. For the second criteria block, set **Criteria_range2** to *Delivery mode (Column C)* and **Criteria2** to *Remote*
5. You will now see a preview oft the average engagement score of **all** remote learners who attend their classes - 71.5
6. Click **OK** to add it to the spreadsheet

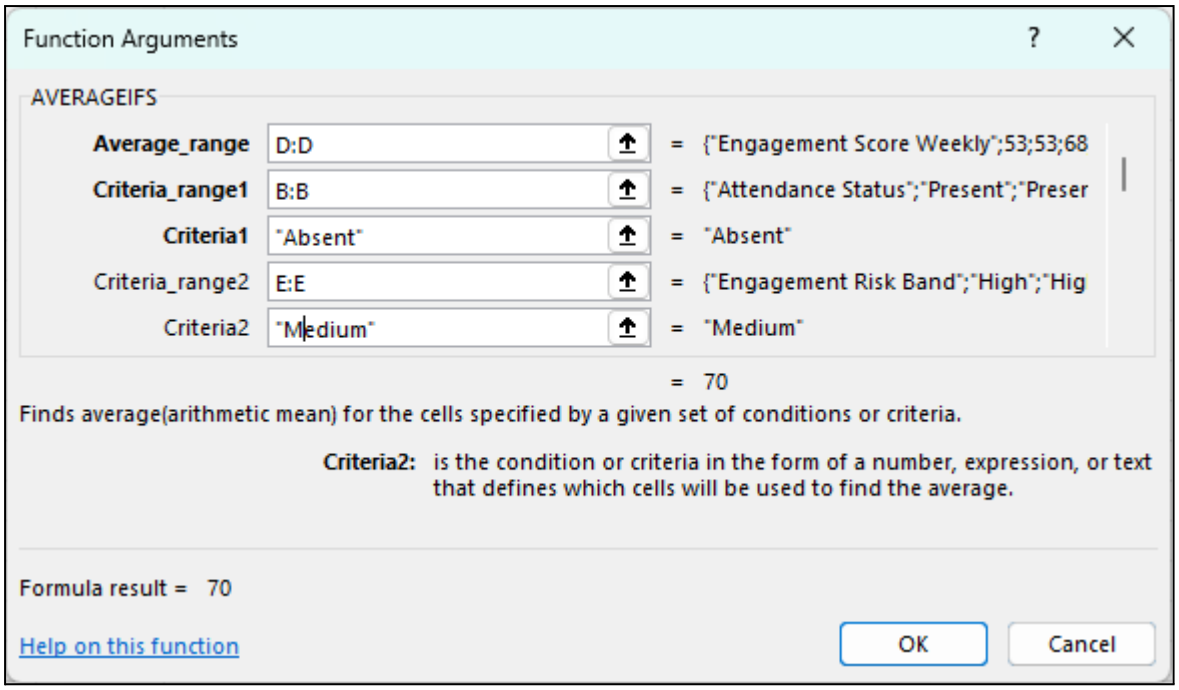


Question 5

What is the average engagement score for **Absent AND High Risk students**?

What Excel is doing:

1. Excel checks BOTH conditions
2. It only includes scores where BOTH match



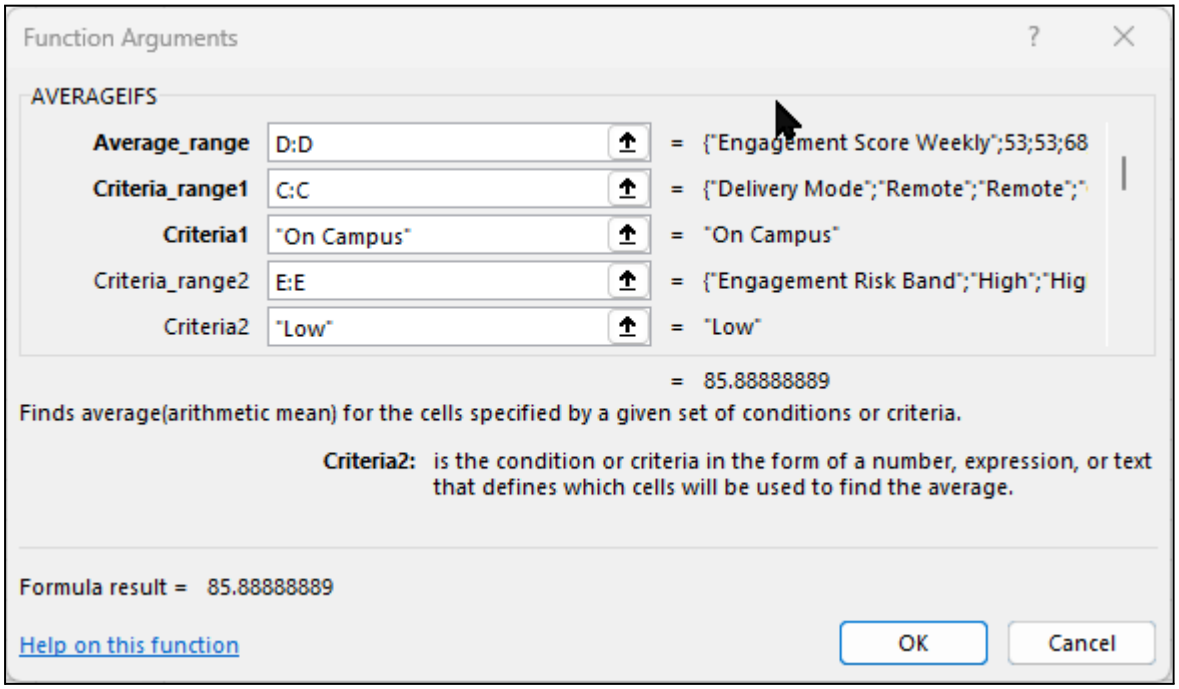
You should receive a value of 70

Question 6

What is the average engagement score for **On Campus AND Low Risk students**?

Same logic again:

1. Check row → both rules true → include number
2. Otherwise → ignore



You should receive a value of 85.89

Final Summary

What Excel is doing every time:

- It looks at one row at a time
- It checks your rule(s)
- If rules match → include the number
- If not → ignore it
- Then it calculates the average

The only difference between functions:

- AVERAGE → average everything
- AVERAGEIF → average if ONE rule is true
- AVERAGEIFS → average if MULTIPLE rules are true

The simplest way to remember:

AVERAGE = “What is typical?”
AVERAGEIF = “What is typical for this group?”
AVERAGEIFS = “What is typical for this group AND this group?”
